## 1. PROJECT OVERVIEW

This project demonstrates Azure cloud administration tasks within a controlled Microsoft Azure environment, focusing on infrastructure deployment, identity management, automation, and access control.

The implementation includes the provisioning of cloud resources using Azure CLI, deployment of a Windows Server virtual machine, and configuration of identity services through Microsoft Entra ID. User accounts and security groups were created to simulate a structured organizational environment.

To improve efficiency and scalability, dynamic group membership was configured based on user attributes, allowing automatic assignment of users to appropriate groups without manual intervention. In addition, Role-Based Access Control (RBAC) was implemented using custom roles to manage administrative permissions in a controlled manner.

The project reflects practical cloud administration workflows commonly used in enterprise environments, particularly in managing resources, identities, and access policies within Microsoft Azure.

## 2. OBJECTIVES

- Deploy and configure core Azure infrastructure using Azure CLI
- Implement a structured cloud environment using resource groups and virtual machines
- Configure identity management using Microsoft Entra ID
- Apply role-based access control (RBAC) for permission management
- Automate user access through dynamic group membership rules
- Validate identity and access configurations through testing

## 3. ENVIRONMENT & TOOLS

- Microsoft Azure – Cloud platform for deployment and management
- Microsoft Entra ID – Identity and access management
- Azure CLI – Command-line automation tool
- Windows Server 2016 (MoonTechVM) – Virtual machine operating system
- Resource group management
- Virtual machine deployment
- User and group management
- Dynamic group membership
- Role-Based Access Control (RBAC)

## 4. IMPLEMENTATION DETAILS

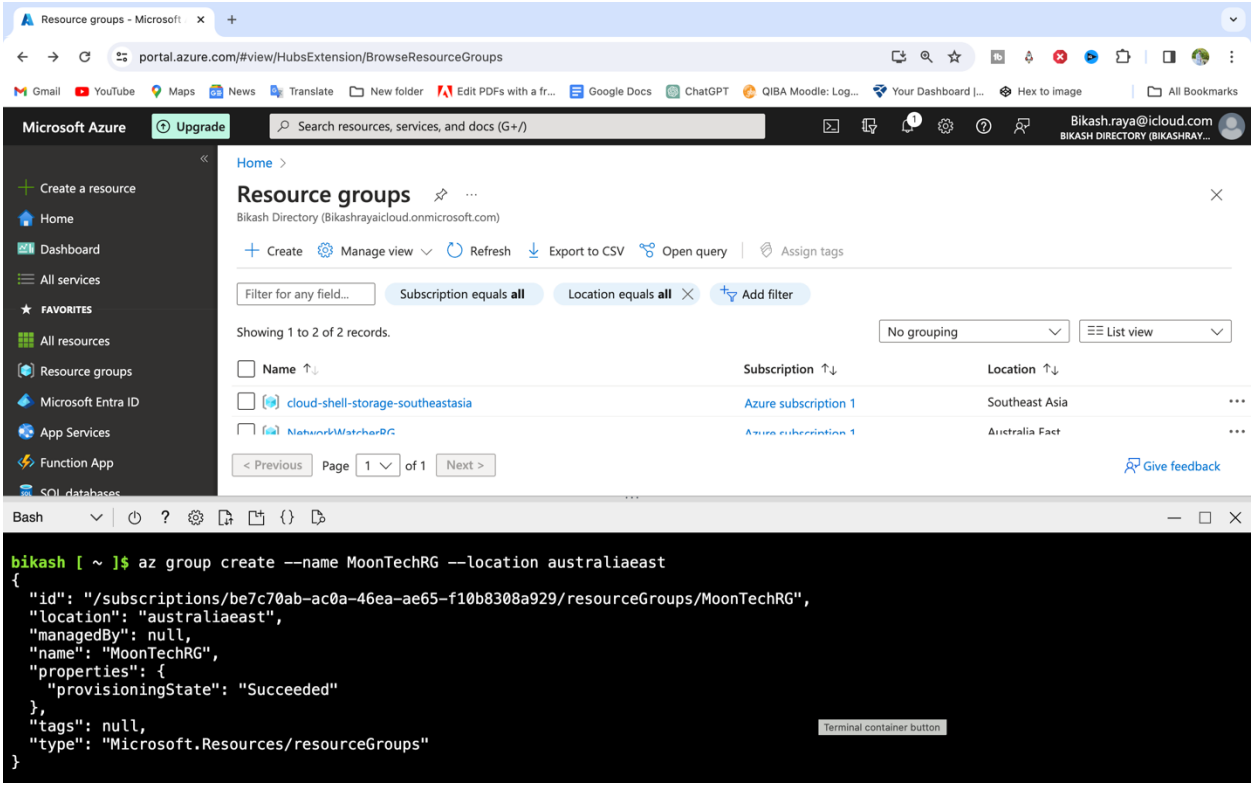
### 4.1 RESOURCE GROUP CREATION

The first step involved creating a resource group in Microsoft Azure named **MoonTechRG**.

Using Azure CLI, an Azure resource group named **"MoonTechRG"** was created in the **Australia East** region.

This resource group acted as the primary logical container for all resources deployed within the MoonTech Azure environment, enabling centralized management, monitoring, and governance.

*Screenshots: Resource Group Creation*

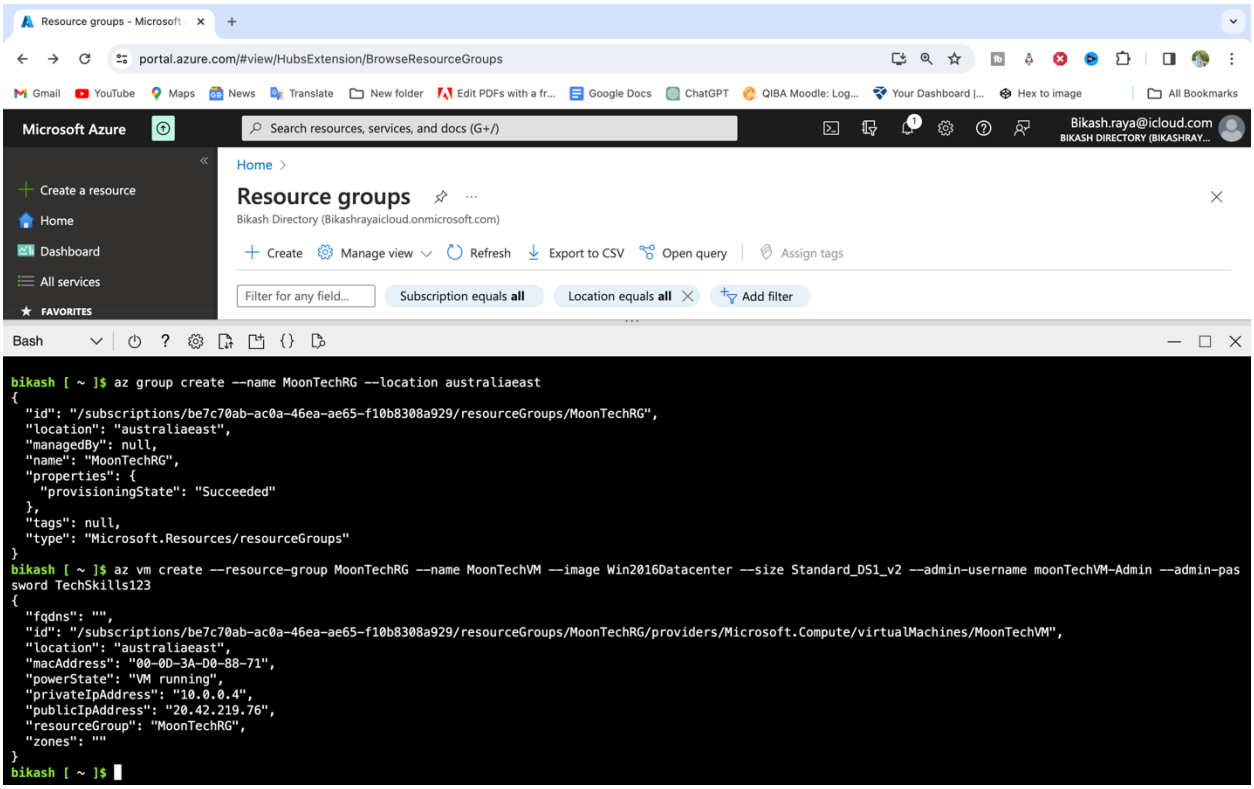


## 4.2 VIRTUAL MACHINE DEPLOYMENT (MOONTECHVM):

• Using Azure CLI, a Windows Server 2016 Standard virtual machine named **"MoonTechVM"** was deployed within the **"MoonTechRG"** resource group.
• An appropriate virtual machine size was selected based on expected workload and performance requirements.
• Networking components including virtual network, subnet configuration, and security settings were configured during deployment.
• Storage was provisioned using managed disk configuration to ensure reliability and scalability.

The virtual machine served as the primary compute resource for system administration and simulated enterprise server operations within the Azure environment.

*📸 Screenshots: Virtual Machine Deployment*



## 4.3 USER AND GROUP MANAGEMENT

User accounts for **Tim, Jack, Ronaldo, and Messi** were created in Microsoft Entra ID using Azure CLI.

Two security groups were then created:

- **MoonTechSales**
- **MoonTechMarketing**

These groups were used to represent different departments and to organize users accordingly.

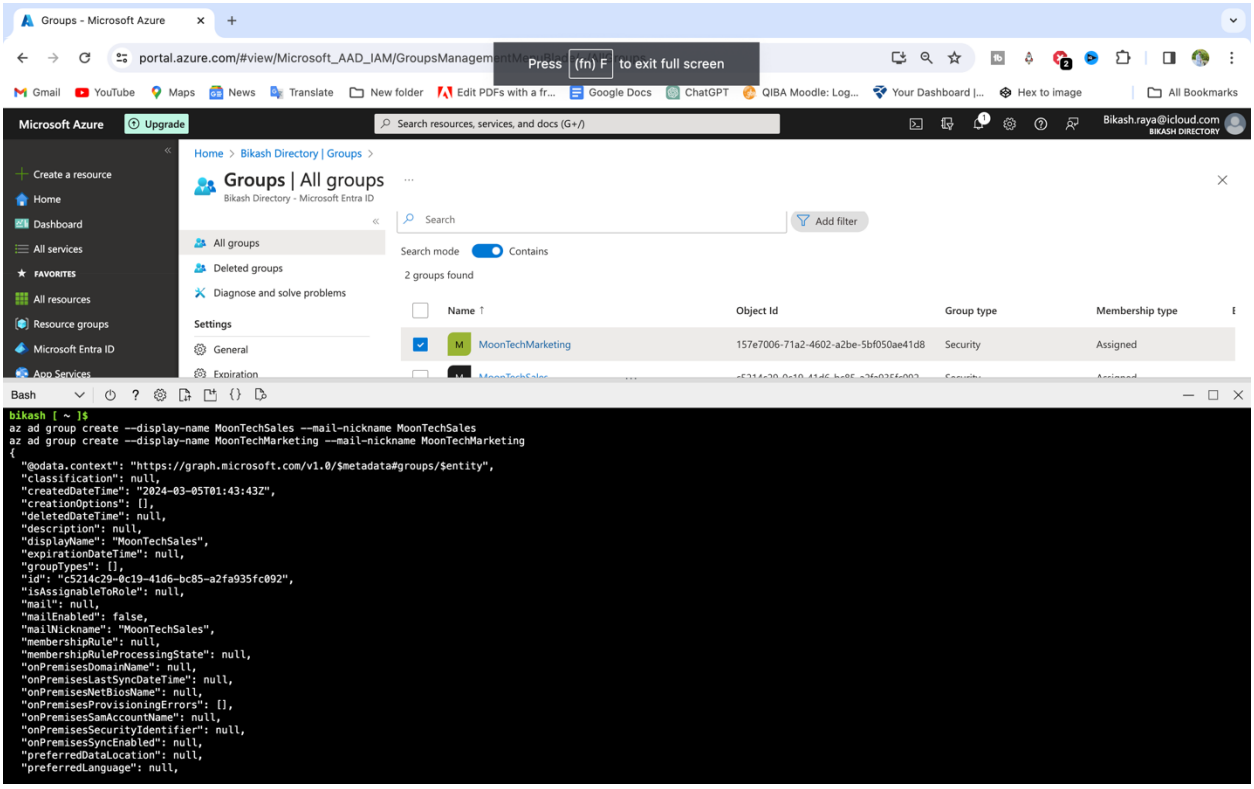
Creating Groups:



## 4.4 DYNAMIC GROUP CONFIGURATION

Dynamic group membership rules were implemented for **"MoonTechSales"** and **"MoonTechMarketing"** based on user attributes within Microsoft Entra ID.

The Department attribute was used as the condition for automated group assignment.

User attributes were configured as follows:

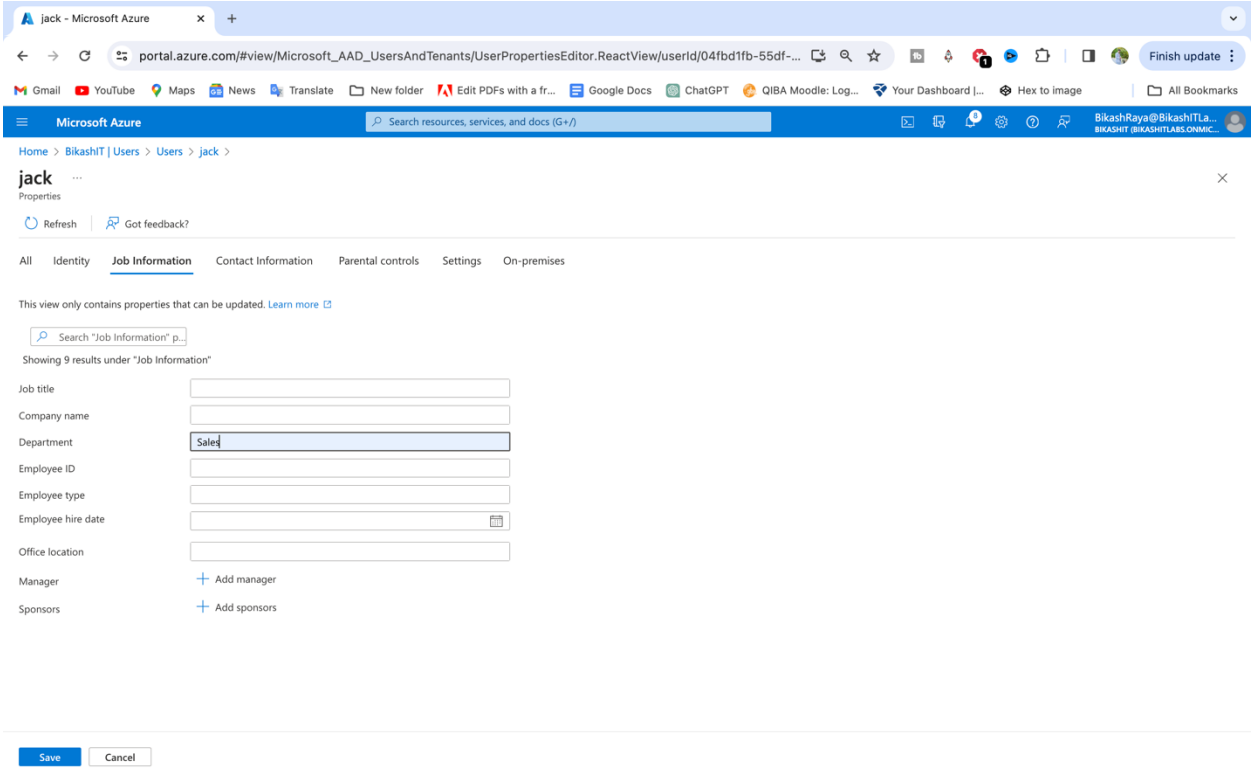
- Tim → Sales
- Jack → Sales
- Ronaldo → Marketing
- Messi → Marketing

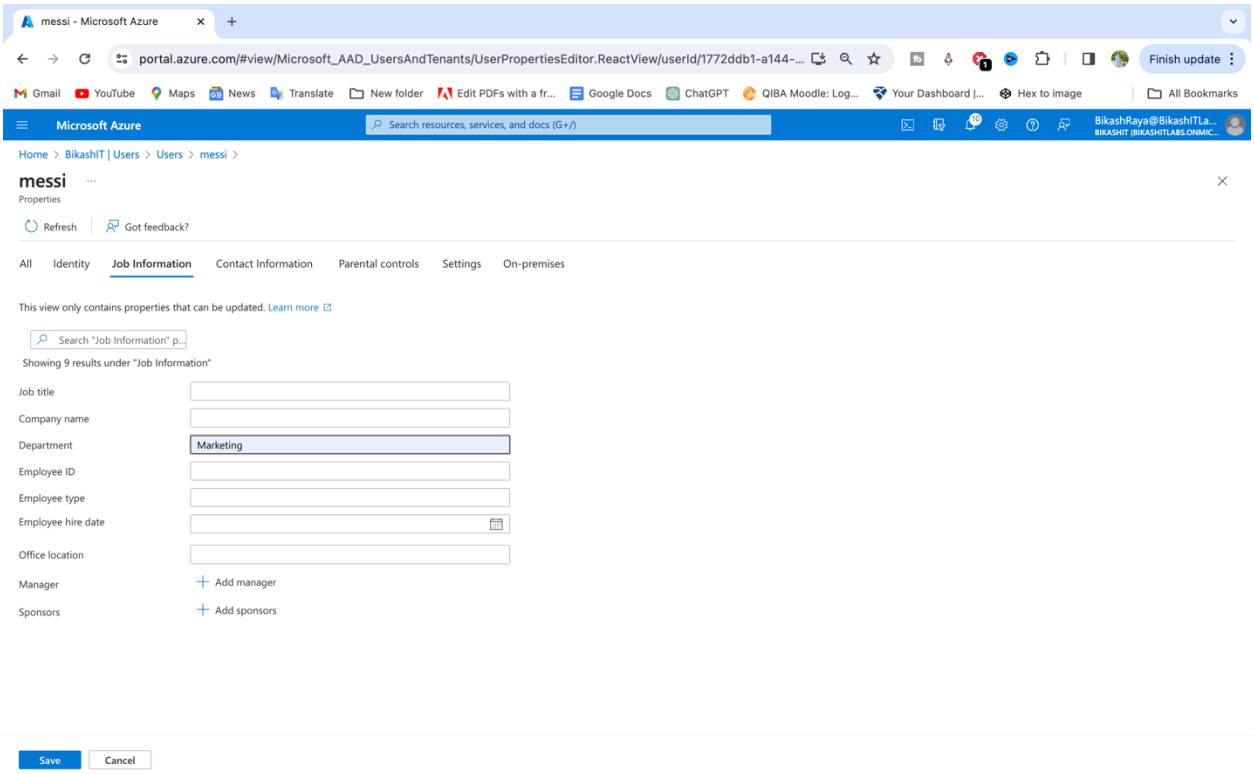
Based on these attributes, users were automatically assigned to their respective groups:

- Tim and Jack were automatically added to **MoonTechSales**
- Ronaldo and Messi were automatically added to **MoonTechMarketing**

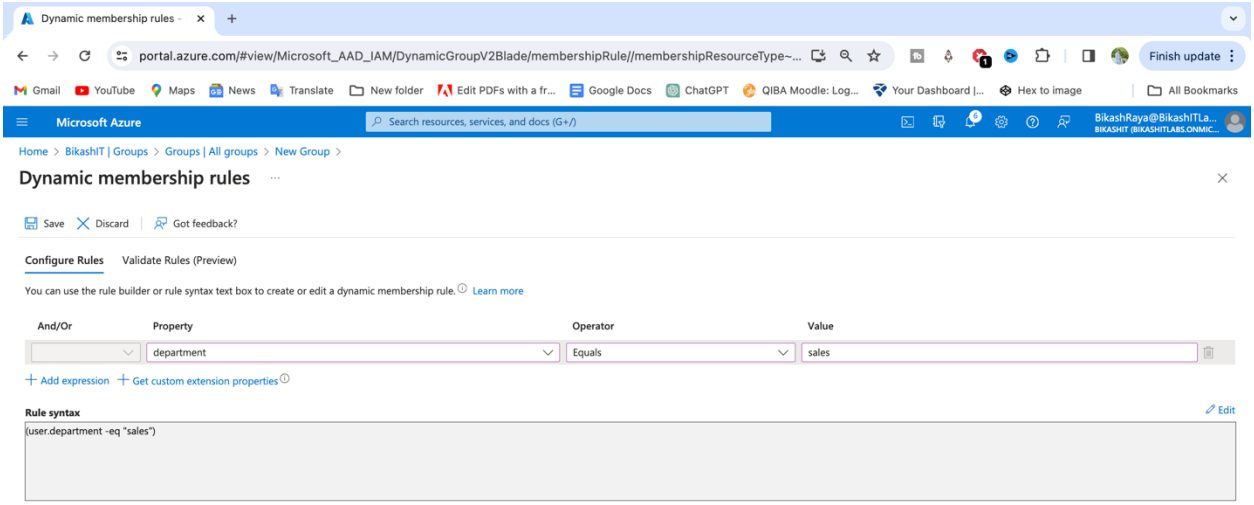
This implementation ensured automated identity governance and eliminated manual group assignment overhead.

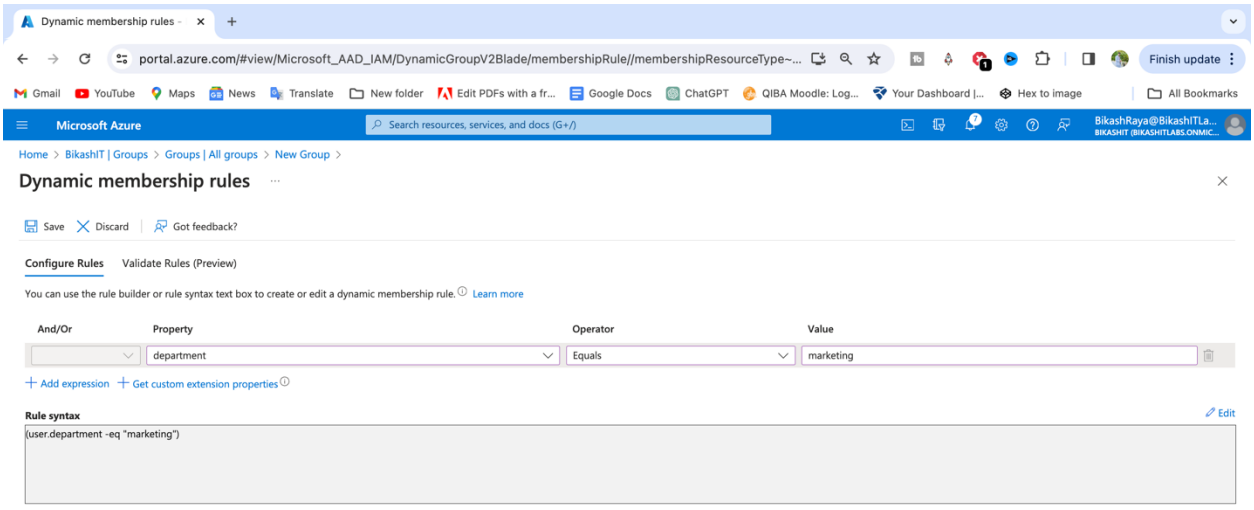
## 📸 *Screenshots: Dynamic Group Membership Rules Configuration*





Setting dynamic group membership rules for MoonTechSales and MoonTechMarketing based on user attributes “sales” and “marketing”:

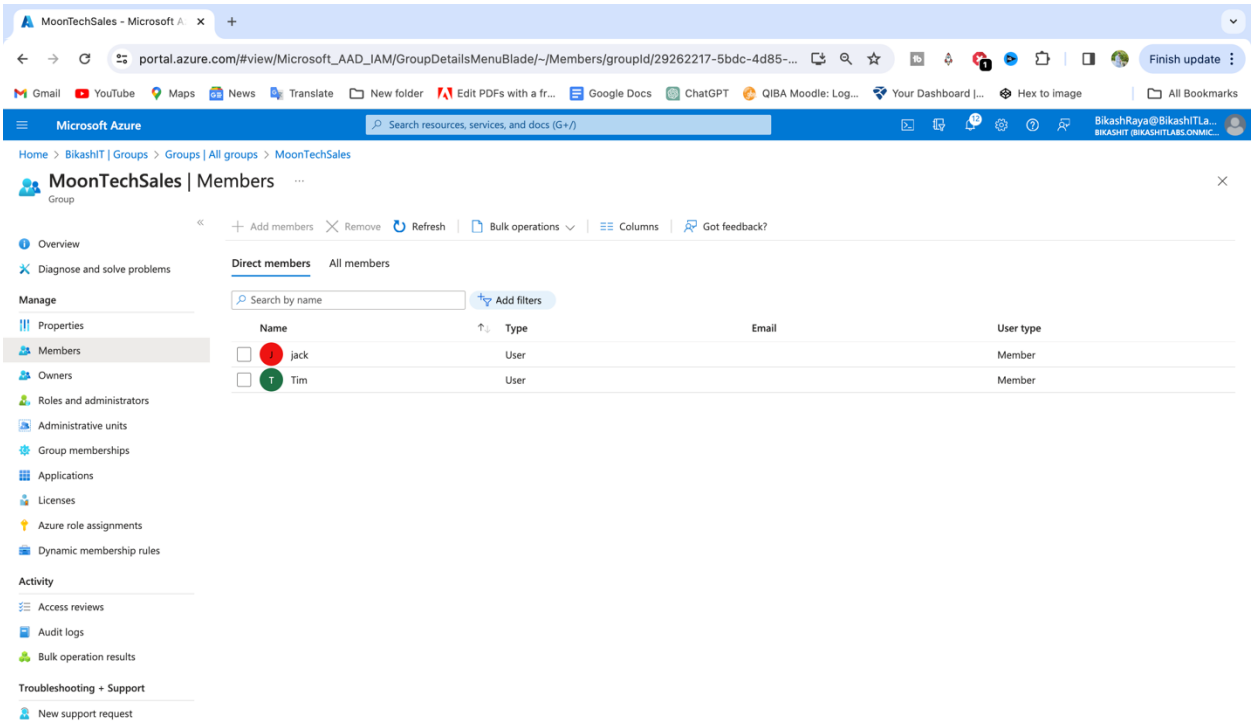


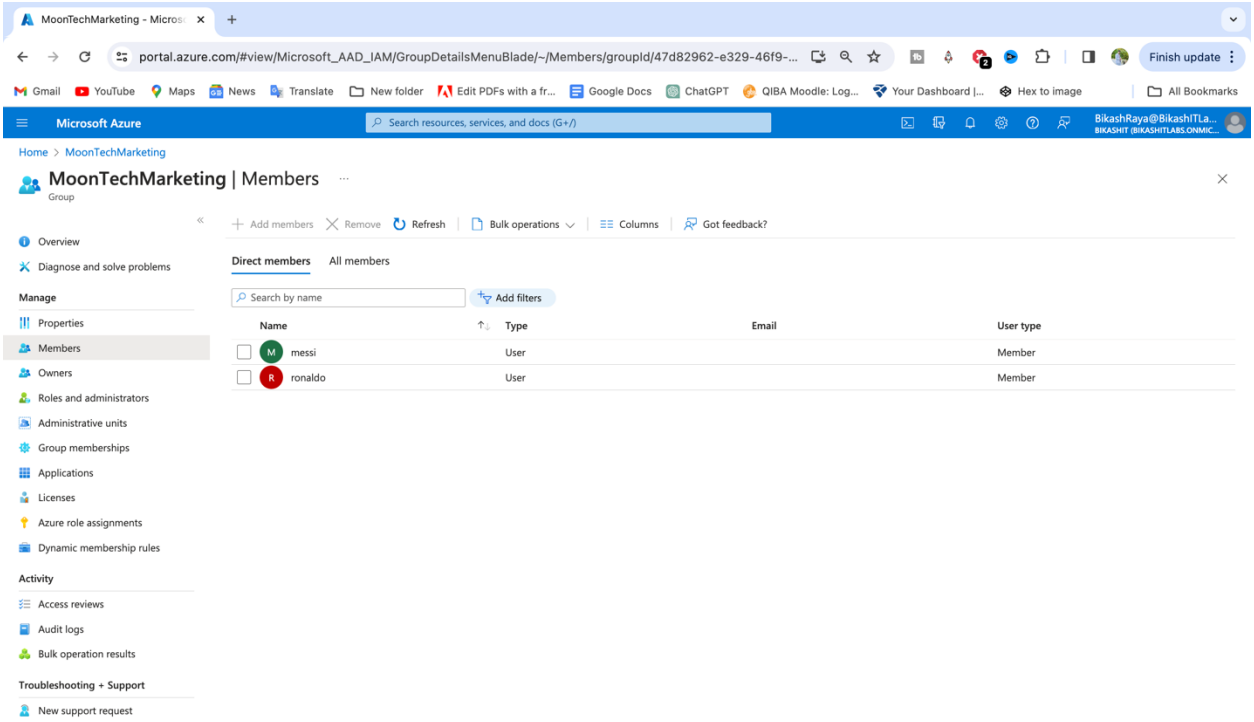


## 4.5 VALIDATION OF DYNAMIC ASSIGNMENT

Group membership was validated to confirm that Tim and Jack were automatically added to the MoonTechSales group, while Ronaldo and Messi were assigned to the MoonTechMarketing group based on the defined dynamic rules

*Screenshots: Validation of Dynamic Group Membership Assignment*





## 4.6 ROLE-BASED ACCESS CONTROL (RBAC) CONFIGURATION

A custom RBAC role named **SalesAdmin** was created with permissions to manage user assignments within the MoonTechSales group. This role was assigned to Ronaldo.

Another custom role named **MarketingAdmin** was created with permissions for managing the MoonTechMarketing group. This role was assigned to Messi.

These configurations demonstrate controlled delegation of administrative access.

## 5. CONCLUSION

This project demonstrates the successful setup of a Microsoft Azure environment, including resource provisioning, virtual machine deployment, identity management, dynamic group automation, and RBAC implementation.

The implementation reflects key cloud administration practices, including structured resource management, identity governance, and secure access control in Azure environments.
